circle plus an exponential form

Each branch starts out wide and narrows as it goes

to the center and then widens again as it goes

outward. The width of the branches is proportional to the

square of the distance from the center.

The figure-eight shape is a special case of this

more general form.

When the two branches are not parallel, the figure-eight

shape is a special case of a more general form.

The width of the branches is proportional to the square of the

distance from the center. The figure-eight shape is a special

case of this more general form.

The width of the branches is proportional to the square of the

distance from the center. The figure-eight shape is a special

case of this more general form.

The width of the branches is proportional to the square of the

distance from the center. The figure-eight shape is a special

case of this more general form.

The width of the branches is proportional to the square of the

distance from the center. The figure-eight shape is a special

case of this more general form.

The width of the branches is proportional to the square of the

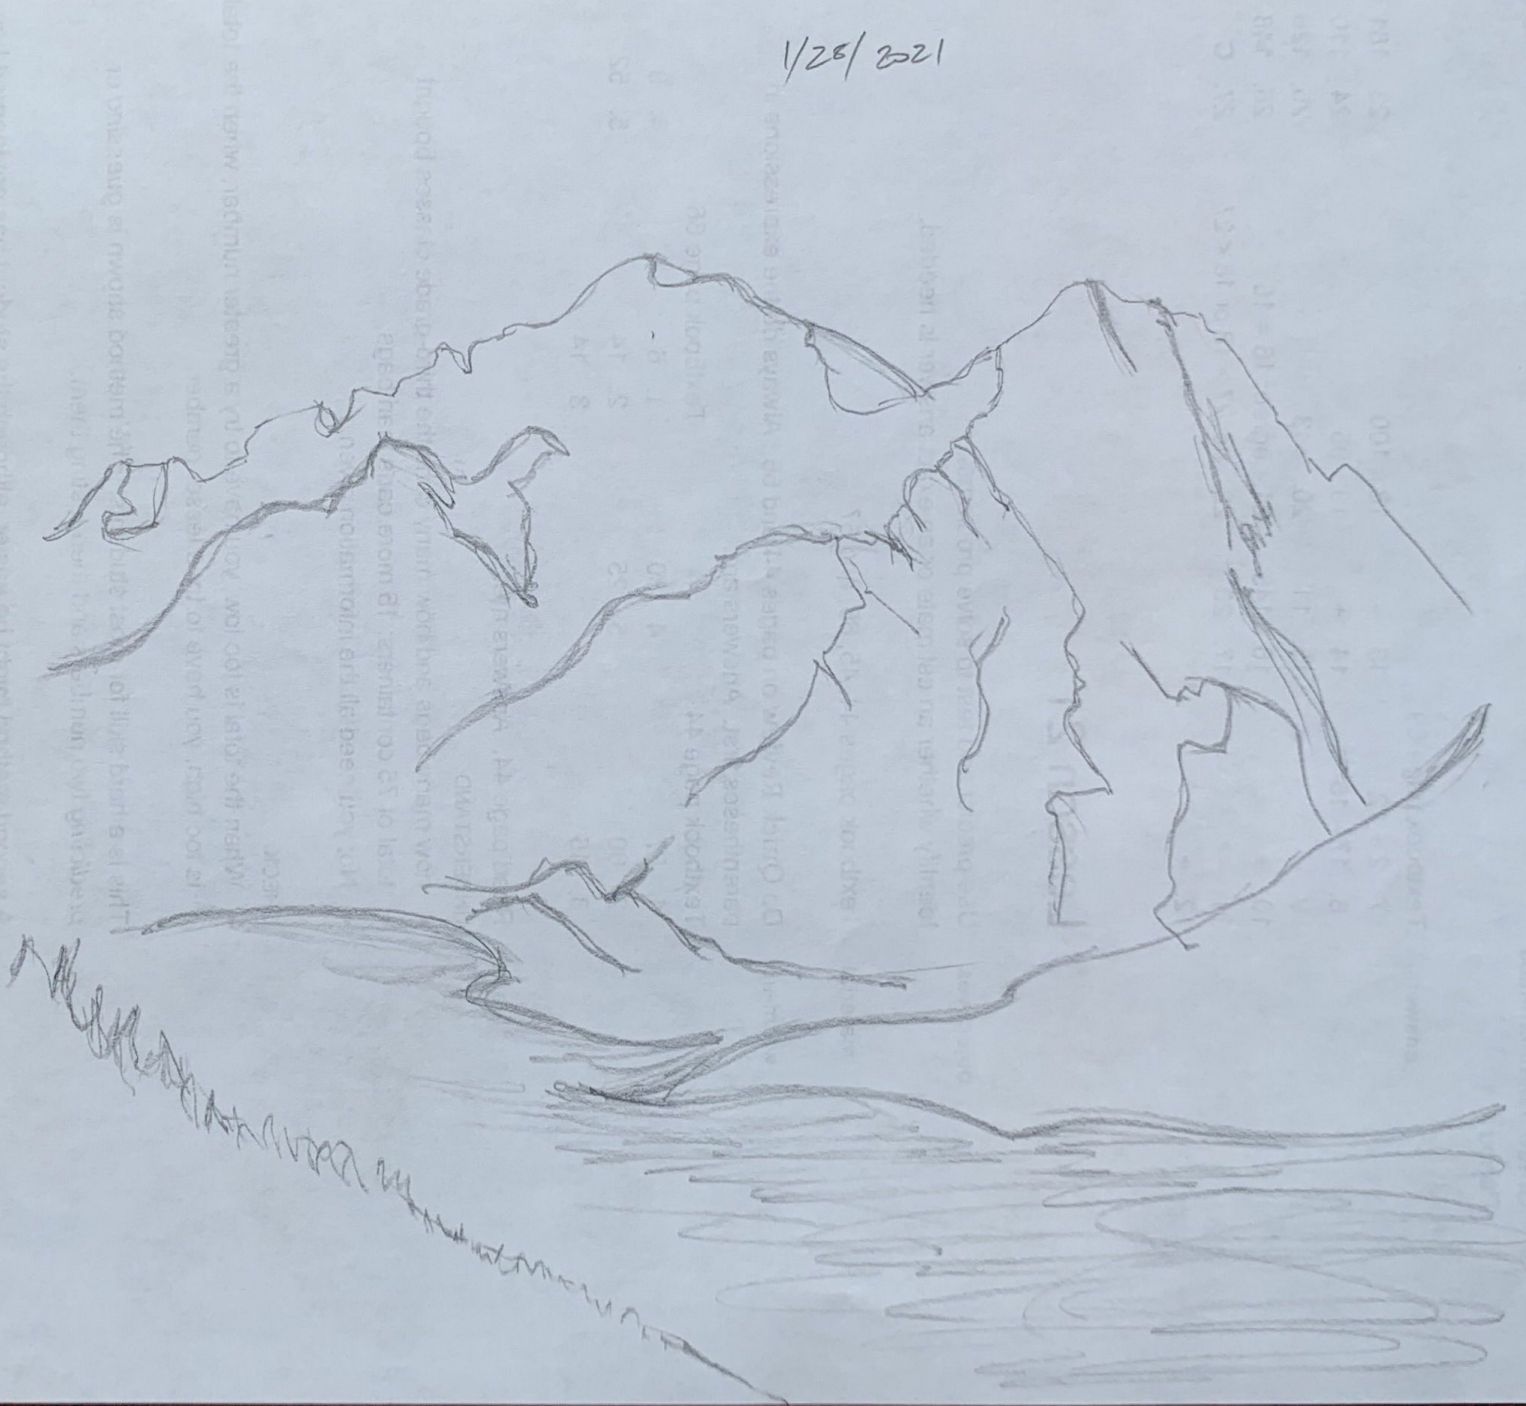

distance from the center. The figure-eight shape is a special

case of this more general form.
